Network-Based Risk Analysis

The aim of the Estonian Tax and Customs Board’s project is to automate and improve data analysis in order to better identify and manage tax-related risks. The system is intended to detect significant relationships, patterns and risks in data, produce more accurate forecasts, and identify ways to improve work processes. This includes reducing the administrative burden on businesses and minimising unnecessary interactions with the Estonian Tax and Customs Board.

Project duration: 2024–2025

The project was funded by the Public Sector Innovation Fund
